I know no details about the system for industrial mobilization, and the following comments are merely assumptions. I believe that in each area committee there is a section which concerns itself with industry. I think that they would be the ones who would be concerned with storage of industrial products.	"
There is no set number per military district in the USSR. Naturally there are some in all of the military districts but their actual location is determined more by strategic location of the area and ease of access to the material producing plants. Control of the central storage depots is exercised by the Ministry of War. I believe that the stock comes straight from the factories where it is manufactured to the warehouses of the central storage depots. It is then distributed to the field units. I think, but am not sure, that it is supplied directly to the Army which in turn issues it accordingly through channels down the line.	
According to the regular norm, each soldier is supposed to have an untouchable reserve of three days supplies of all types. Each regiment is supposed to maintain a 10 day reserve; each division, approximately one month's supply of reserves; and each army, approximately three months' reserve of all types of supplies. I knew of some units which were overstocked and had more than the required amount of supplies on hand. I believe that the Soviet Army has a minimum of three months' supplies, although it would probably take only one month to over-run all of Europe with the exception of the Iberian Peninsula.	
I know of a Quartermaster School in Leningrad which is a sort of graduate school for newly commissioned officers. I have heard of a Quartermaster Academy in Mas-	
res. I know of an artillery outfit with 76-mm guns at Cherkassy in the Ukraine with horse drawn transport. I believe it is probably a mountain unit. Also many permanent quartermaster installations have a high percentage of horse drawn wehicles. All these are in the USSR and I do not know of any units in Germany relying on horse drawn transport as their basic means of movement. Although cavalry outfits did not justify themselves in World War II, horses used for transport proved to be very valuable especially in areas of movement.	
In the collective and state farms, about 10% of the horses and wagons are kept in an army fund. They cannot be used in heavy work and must be kept in good condition at all times. Since they are inspected from time to time by the Voyenkommant, the collective must stand the expense of maintaining them in perfect condition for the army at all times. Wagons are now built of a special design so that they can be converted to military use immediately.	
I would estimate that all-in-all probably 10% or more of the Soviet Army is still horse-transported.
